

IDEAS

Title: GreenHouse Gas.

Author: Aaron Tang

Date: 7/10/2024.

Filter

Pie Charts → not ideal for comparing multiple categories

Area Charts → area under the curve can make it difficult to precisely compare values at specific points in time.

Categorize.

- Group data by continents or economic blocks
- categorize countries as developed, developing, or underdeveloped to compare emission pattern.

Combining and Refining

- group sectors like agriculture, and land use together to see their combined effect on total emissions
- refine the data to highlight key time periods, such as during major international agreements

Questions.

- 1) Is the visualization intuitive and easy to understand for target audience.
- 2) How might this visualization influence decision making in educational and economic sector.

Layout

Global CO₂ Emission Overtime.

Stack Bar

Title: Greenhouse gas.

Author: Aaron

Date: 8/10/2024.

sheet: 2

Focus.

- GHG Analysis Dashboard.
 - give users a clear and interactive way to explore greenhouse gas data from different perspectives.
- spend most time toggling between different visualizations

Operations

- allow users to zoom in on specific period
- users can toggle between sector
- toggle to see emissions per capita

Advantage.

- explore GHG data from multiple perspectives, making it easier to derive insights
- can filter, zoom, and select different views.

Disadvantages.

- overload of information
- find dashboard overwhelming.
- hard for non-technical users to understand.

Layout

Cumulative Global GHG.

Top 5 countries.

Breakdown of GHG Emissions by gas.

population vs GHG

(proportional symbol map).

Radar Chart
→ GHG emission from multiple sector.

Name: Aaron

Title: Greenhouse gas

Date: 10/10/2024

Sheet: 3

Operations

- hover over specific years to see cumulative GHG
- clicking on different gases in the donut chart provides more detailed information about emissions
- select different countries from a drop down to see how sector specific emissions compare within each nation.

Focus

- focus on comparing emissions across various sectors, countries, and gases.
- a dashboard where users can click on different sections to view sector-specific data for selected countries.

Advantages

Diverse Perspectives

- allow users to view emissions data from multiple angles
- adds a dynamic and engaging element to the data.

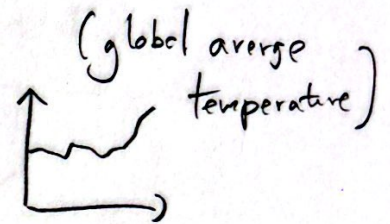

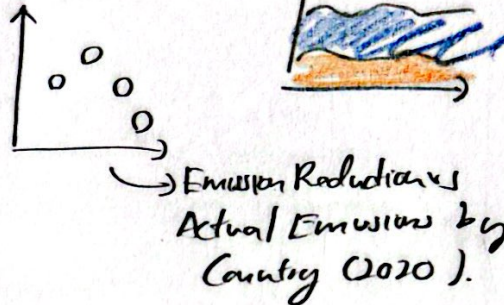

Disadvantages

- hard for user to interpret radar chart
- a lot of interaction may require extra explanation for users to fully understand what the data represent.

Layout

Global GHG Emissions by gas type over time

Name: Aaron
Title: greenhouse gas
Date: 4/10/2024
Sheet: 4

Focus

- users will likely spend most of their time interacting with the map and Stacked Area Chart to understand emissions intensity
- hover over countries in the map to see emissions per capita

Advantages

- provides a long term view of how the composition of GHG emissions has evolved, giving insights into trends.
- useful for spotting periods of accelerated emissions, increases or decreases

Operations

- click on countries to get detailed information
- zoom in on specific time periods to see how individual gases like methane or CO₂
- see percentage change

Disadvantages

- require additional explanation for users
- visually overwhelming
- provides limited information

Layout

Based off sheet 4.

choropleth map

stacked area chart

stacked bar chart

By sector.

line chart

} global average temperature.

→ CO₂ emission per capita vs GDP.

Focus.

- provide a comprehensive review of GHG emissions on a global scale, broken down by country, gas type, and sector,
- focus on comparing country-specific emission using the map.

Name: Aarav

Title: greenhouse gas.

Date: 12/10/2021

Sheet 5

Operations

- Hover over a country
- zoom into specific time period
- toggle between sectors to view specific emissions contributions
- Hover over specific years to see exact global temperature values.
- tooltips display the average.

Detail

- R for data cleaning
- Vscode to code
- Vega Lite Editor for making graphs
- own a git hub account.

Estimated time and effort: 7 days to build all idiom and 3 days for final design.

specific requirement: laptop and desktop.
